ABSTRACT

This report series defines and measures the "information activity" within the national economy. "Information activity" is defined to include those specific industries and occupations whose primary function is to produce, process, or transmit economically valuable information. Changes in the national labor force are analyzed over a 120-year span. This volume consists of a table of 422 occupations and 108 industries showing the wages paid by each industry to each occupation in 1967. This is backup information to Chapter 7 of Volume I (IR 005 061). (Author/DAG)

**UNITED STATES DEPARTMENT OF COMMERCE
OFFICE OF TELECOMMUNICATIONS
STATEMENT OF MISSION**

The mission of the Office of Telecommunications in the Department of Commerce is to assist the Department in fostering, serving, and promoting the nation's economic development and technological advancement by improving man's comprehension of telecommunication science and by assuring effective use and growth of the nation's telecommunication resources.

In carrying out this mission, the Office

- Conducts research needed in the evaluation and development of policy as required by the Department of Commerce
- Assists other government agencies in the use of telecommunications
- Conducts research, engineering, and analysis in the general field of telecommunication science to meet government needs
- Acquires, analyzes, synthesizes, and disseminates information for the efficient use of the nation's telecommunication resources.
- Performs analysis, engineering, and related administrative functions responsive to the needs of the Director of the Office of Telecommunications Policy, Executive Office of the President, in the performance of his responsibilities for the management of the radio spectrum
- Conducts research needed in the evaluation and development of telecommunication policy as required by the Office of Telecommunications Policy, pursuant to Executive Order 11556

FOREWORD

Physics, a discipline at the heart of our last major technological revolution, yields a quotation that is highly appropriate to the present work:

When you can measure what you are speaking about, and express it in numbers, you know something about it; but when you cannot measure it, when you cannot express it in numbers, your knowledge is of a meager and unsatisfactory kind: it may be the beginning of knowledge, but you have scarcely, in your thoughts, advanced to the stage of science.

-- William Thomson, Lord Kelvin
(1824-1907) English Physicist

Notions of yet another major revolution, one that will bring about a "post-industrial" society, have been in the air for some time now. Yet, few steps toward the measurement of this revolution's most important element -- information activities -- were taken until Dr. Porat began the investigation that is reported in these volumes. We might say, then, that this study, truly a seminal one, pushes our knowledge of an information economy closer to "the stage of science."

This report proposes a conceptual framework for defining the information activities of an advanced economy, and prescribes an objective way to quantify them. Without such definition and measurement, I cannot imagine how we can formulate sound policy for an information society. The fact that so many information policy issues are pressing upon us adds to the pertinence of the research.

It may strike some as odd that the Office of Telecommunications, an organization concerned principally with telecommunications technology, would offer a report dealing with the whole range of information activities. The explanation lies in the need to view telecommunications in the larger context of its effects on other aspects of society. Satellite networks, for example, can be an instrument for regional economic development. Retail terminals can perform banking functions. And electronic communications is steadily diminishing the volume of traditional postal delivery. Thus, it is essential to appreciate how issues internal to telecommunications influence other kinds of information activities. Conversely, ways of achieving broader policy objectives might well produce decisions affecting telecommunications services. I have in mind such goals as the provision of equal access to high-quality health care or the expansion of continuing education, both of which obviously can be facilitated by the electronic media. To the extent that telecommunications and its sister technology, computers, are at the core of the infrastructure of the information society, their relationships with the larger society are every bit as important as their internal problems.

(iii)

The concepts and methods described in these volumes have begun to attract wide national and international notice. They are cited by officials of the Congress, the Executive Branch, and the regulatory agencies. They are being studied by international organizations. Yet, in spite of all the acknowledgments, this study constitutes only a point of departure toward a more complete understanding of the information society. We must devise and test alternative representations of the information economy against this one. We still have to settle on the best model, achieve comparability among models in other countries, produce trend data, and construct the methods for predicting consequences of alternative policy decisions.

I am confident that this additional work will be taken up by others. Moreover, I believe that their efforts will sharpen these concepts into a new tool, a tool of great value because of its clear relevance to the course of our world's complex societies.

John M. Richardson
Director

INTRODUCTORY NOTE

Science, commerce and technology are inextricably interconnected in American society. It is therefore fitting that this effort to clarify one aspect of their impact was a joint project of the National Science Foundation and the Department of Commerce. The National Science Foundation provided the funds needed to undertake the project, the Department of Commerce the institutional setting in which to conduct it. The bond was cemented through a common concern with telecommunications technologies and policies.

We were particularly motivated by the prospect of increasing the substance surrounding fascinating concepts about the changing nature of American society. The evident acceleration in invention and application of information technologies and the social and economic change which accompanies this development, is directly relevant to a wide range of policy concerns.

The findings of this research are provocative and concise. We trust that they will stimulate and illuminate public discussion. The report describes some of the ways in which the findings have been applied thus far. Yet it is clear that this work is an incremental contribution and that much remains to be accomplished. Work has begun in the U.S. and abroad to extend the data base developed in the project. I extend an invitation to readers to contribute their reactions to the report and their ideas on further research.

SYNOPSIS

THE INFORMATION ECONOMY Report Series totals nine volumes, each of which has its own subtitle.

- 77-12(1) -- THE INFORMATION ECONOMY: Definition and Measurement -- Dr. Marc Uri Porat -- 265 pp.

This volume contains the executive summary and the major findings of the study. It defines information activity and includes a formal set of National Income and Product Accounts for the primary and secondary information sectors, with input-output matrices for both of these sectors. In addition, it specifies the information-related occupations of both the primary and secondary information sectors; this includes a consideration of private and public bureaucracies. Finally, it presents lists of information policy issues pertaining to industry, government, and the home and makes two recommendations as to how the Federal government might meet the public policy issues posed by the expansion of our information activity.

- 77-12(2) -- THE INFORMATION ECONOMY: Sources and Methods for Measuring the Primary Information Sector (Detailed Industry Reports) -- Dr. Marc Uri Porat -- 188 pp.

This volume presents reports of the 25 major industries that compose the primary information sector. The volume's classification scheme is based on the Bureau of Economic Analysis Input-Output Matrix. Each industry is discussed in great detail. The discussions include the reasoning behind considering the industry as part of the primary information sector, a breakdown of the subordinate industries that compose the larger industrial category, a narrative of the informational aspects of the industry, and a report of the final demand and value-added components. The service, manufacturing, and construction sectors of the economy are considered.

* * * * *

We call to the reader's attention that the most critical part of the entire report series is to be found in the first two volumes. The remaining volumes are essentially supplements to and extensions of Volumes 1 and 2.

- 77-12(3) -- THE INFORMATION ECONOMY: The Interindustry Transactions Matrices (1967) -- Dr. Marc Uri Porat, with the assistance of Michael R. Rubin -- 58 pp.

Volume 3 consists of input-output tables showing transactions in the 1967 economy. One table shows a breakout of 108 industries, another of 190 industries.

- 77-12(4) -- THE INFORMATION ECONOMY: The Technology Matrices (1967) -- Dr. Marc Uri Porat, with the assistance of Michael R. Rubin -- 117 pp.

Volume 4 includes A-coefficient matrices for the 1967 economy at both the 108 and 190 levels of detail.

- 77-12(5) -- THE INFORMATION ECONOMY: The "Total Effect" Matrices (1967) -- Dr. Marc Uri Porat, with the assistance of Michael R. Rubin -- 117 pp.

This volume contains the 1967 Inverse Matrices with detail at both the 108 and 190 industry levels.

Volumes 3 through 5 contain backup information to Chapters 6 and 10 of Volume 1.

- 77-12(6) -- THE INFORMATION ECONOMY: The Labor Income by Industry Matrix of Employee Compensation (1967) -- Dr. Marc Uri Porat, with the assistance of Michael R. Rubin -- 100 pp.

Volume 6 consists of a table of 422 occupations and 108 industries showing the wages paid by each industry to each occupation in 1967.

- 77-12(7) -- THE INFORMATION ECONOMY: The Labor Income by Industry Matrix of Employee Compensation (1970) -- Dr. Marc Uri Porat, with the assistance of Michael R. Rubin -- 91 pp.

Volume 7 consists of a table of 422 occupations and 108 industries showing the wages paid by each industry to each occupation in 1970.

Volumes 6 and 7 contain backup information to Chapter 7 of Volume 1.

- 77-12(8) -- THE INFORMATION ECONOMY: National Income, Workforce, and Input-Output Accounts -- Dr. Marc Uri Porat, with the assistance of Michael R. Rubin -- 91 pp.

This volume contains backup material to Chapters 4 and 9 of Volume 1. It consists of a number of tables, including those that show trends in the labor force over time and National Income Accounts information.

- 77-12(9) -- THE INFORMATION ECONOMY: User's Guide to the Complete Database -- Michael R. Rubin -- 71 pp.

This volume is a user's guide to the computer model which describes the information elements of the economy in the benchmark year 1967. The database is available on magnetic tape through the National Technical Information Service, Springfield, Virginia, Accession No. PB-264 172, titled "The Information Economy."

ACKNOWLEDGMENTS

This report was prepared with partial support of National Science Foundation grant No. APR-7609015. Any opinions, findings, conclusions, or recommendations expressed in this document are those of the author and do not necessarily reflect the views of the National Science Foundation.

A dissertation entitled The Information Economy is available from: University Microfilms, 300 N. Zeeb Road, Ann Arbor, Michigan 48106 (Attn: Dissertation copies), Accession No. 77-7147.

To Fritz Machlup and Daniel Bell I owe a deep intellectual debt for plowing the field so thoroughly and proficiently before me. After their contribution, mine was simply to harvest the crop that they had planted; and there is ample left for future researchers who wish to embark on this new line of research.

My early ideas, ill formed and overly ambitious, were skillfully and gently molded by the able hands of Professors Edwin Parker and James Rosse. They had the good sense to say both yes and no at just the right moments, and were always accessible when I needed guidance. The last and most critical year of this work was made possible through the good graces of Dr. John Richardson, Director of the Office of Telecommunications, who gave freely of his encouragement and support, and who smoothed the bureaucratic wrinkles when they seemed to mount like tidal waves. He understood the policy implications of this work before most.

Generous financial support from the National Science Foundation was the lifeblood for this project. Dr. Charles Brownstein (RANN/Division of Advanced Productivity Research and Technology) managed the project most professionally, and his advice and consent were very helpful and greatly appreciated.

Over the course of the project, I drew heavily on the talents and energies of many people, and to them I extend a special gratitude. Michael Rubin, who joined me nearly three years ago, single handedly slew the computer dragon. His all night sessions outnumbered mine by two to one, and resulted in Chapters 6, 7, & 10. Joseph Kashi assembled most of the government and labor data of Chapters 7 and 8. Deborah Semb and Barbara Mikelson delivered the National Income and Product Accounts and time series of Chapters 4 and 5.

From the thousand and one production nightmares, I was rescued by the skill and perseverance of Fran Sills. She administered endless drafts of tables and text with dispatch and poise, working many evenings and weekends at top efficiency. Her performance in this project was superb. Glynetta Perrymore endured the dark ages of word processing through five complete drafts of the text. Edith Unila thoroughly and competently helped with the final stages of proofreading and editing.

Along the road, many kind people lent me a helping hand. At the Bureau of Economic Analysis, I was given free reign by Philip Ritz, Chief of the Interindustry Division. Carolyn Knapp and Elizabeth Spaulding helped with the more obscure procedures used in the national accounts. Howard Schreier helped with programming the final demand and value added tables.

At the Bureau of Labor Statistics, I extend my thanks to Charles Bowman and the input-output staff of the Economic Growth Project. The early labor data were provided by John Shew and Karen Hassmer, and their help is acknowledged.

Although I gratefully share the credit with my friends and colleagues, I relieve them of any responsibility for remaining errors.

APPENDIX SEVEN

This report contains the following backup information to Chapter 7 of Volume I:

- (i) A description of the 1967 matrix of Employee Compensation, and a discussion of its potential research value.
- (ii) A discussion on the sources and methods used in producing the 1967 matrix of Employee Compensation. The methodology used to create a Proprietor's Income matrix is also discussed.
- (iii) A detailed listing of the industries contained in the matrix (Table 1).
- (iv) The 1967 matrix, showing the wages and supplements earned by 422 occupational groups in 108 industries. It is a complete inventory of labor factor costs, decomposed into the most detailed occupational categories available (Table 2).

Description and Uses

The purposes for building the 1967 Employee Compensation matrix are manifold:

- (i) It provides a breakdown of employee compensation and proprietors' income that are aggregated into the classes of "information workers" discussed in Chapter 7.
- (ii) It provides a breakdown of value-added components which are used in the consolidated primary sector accounts (Chapter 4) and in the secondary sector accounts (Chapter 9).
- (iii) It provides underlying data for the breakdown of government workers' income into primary and secondary categories (Chapter 8).
- (iv) It is useful to other researchers who need a detailed occupational breakdown of each industry in the economy.

The researcher now has a complete vector of employee compensation by type of worker for each industry in the economy. The wage matrix is useful where a detailed breakdown by industry is needed. For example, research on productivity might require aggregation of labor into various classes (e.g., "information machine workers") that are not conventional.¹ Growth rates on different jobs and salaries can be introduced into the matrix. If a particular occupation is deemed sensitive to automation, an exact count of the total wages paid to that

salary (by industry) is easily available. Substitution between different types of occupations can be traced.

Research on production functions can use the wage matrix since the industrial categories are identical to both the Input-Output matrix (for current account inputs) and the capital flow matrix (for machines and structures). The three matrices together provide a complete inventory of the factor costs broken down by detailed industry.²

Other types of social science research can also be aided by a wage matrix. The occupational hierarchy in the economy is revealed, showing the relative earnings of different occupational groups within a particular industry. Underlying the matrix are a variety of demographic and economic statistics -- on race, sex, region, education level -- which can be factored into the wage matrix.

The 1967 Employee Compensation matrix is fully reconciled with the National Income and Product Accounts, the Input-Output matrix, and the Census of Populations.

Sources and Methods

Our starting data base is the 1970 Occupation by Industry matrix produced by the Bureau of Labor Statistics (BLS). The BLS matrix is an unpublished version of a Census matrix by the same name showing 422 detailed occupational types and their participation in 201 industries. The BLS matrix is edited and uses revised estimates based on independent surveys.

Producing Three Classes of Workers

The first procedure was to separate the BLS matrix into several different classes or workers. This step is necessary for a simple reason. The Input-Output matrix and the National Income Accounts break labor into (i) employee compensation, which are the salaries and supplements of employees (including government); and (ii) profit-type income, which includes the "salaries" of self-employed proprietors and unpaid family workers. In order to distinguish the different classes of income, the matrix was disaggregated into the three classes of workers -- employees, proprietors and unpaid families.

In addition, Federal, State, and local government workers were removed from the matrix and allocated entirely to general government and government enterprises.

Producing the Unadjusted Wage Matrix

Once we separated the BLS matrix into three classes we were ready to produce the first unadjusted employee compensation estimates by occupational type. The procedure is to scale each row (occupation) of the matrix by the corresponding average wage for that occupation, rendering an unadjusted wage matrix.

We obtained average wages (by occupation) from the 1969 Census of Populations, the best data available. Male and female incomes were drastically different, so that a weighted average wage was first computed for the 422 occupations. This vector was then scaled through the matrix, giving us preliminary row totals on the occupations. At this state, the matrix consisted of 1970 "people" weighted to 1969 "wages."

Producing the Adjusted Wage Matrix

We know the correct total 1967 employee compensation to be \$471,090 million. This step began by scaling the sum of the occupation control totals to the desired control total. (Note: since we are still using 1970 figures, a comparison is in order. In 1970 the actual employee compensation was \$522,415 million excluding military; the unadjusted employee compensation totalled to \$528,538 million -- an encouragingly close result. This meant that the adjustment to lock the 1970 matrix in place would only be around 1.1%. We then scaled the 1970 total to the 1967 total, since the entire I-O study is keyed to 1967.)

Once this part was complete, the occupation (row) control totals were frozen. We then determined the industry control totals using data from the BLS, the Civil Service Commission, the BEA and the IRS.³ Again, the industry (column) control totals were developed using known total employee compensation for each industry. The sum of all industries' employee compensation is, as before, \$471,090 million.

With the two control totals locked in place, we "balanced" the matrix by using an iterative procedure. With very few passes of the "rocking" technique, the unadjusted 1970 wage matrix was brought into conformity with the 1967 known employee compensation.

Three assumptions were made regarding the data: (i) That the occupational structure of U.S. industries did not change significantly between 1967 and 1970, or that the relative composition of occupations in each industry did not change; (ii) That relative wages remained constant between 1969 and 1967, or that wages all moved together in response to new price levels. This assumption was predicated on our using 1970 "people," 1969 "wages," and 1967 as the year of interest; (iii) That the ratio to supplements to wages and salaries was constant across occupational types. This assumption was necessary because we do not have separate average supplement figures -- as opposed to average wages -- but we know the total employee compensation which includes supplements. These assumptions might seem heroic at first, but they proved to be quite valid.

The results of this procedure are (i) to produce a balanced 1967 matrix that totals to the 1967 employee compensation figure of \$471,090 million; (ii) to be consistent with industry control totals for employee compensation; (iii) to reflect the underlying occupational structure; and (iv) to be consistent with average wages paid to each occupation.

Producing the Reaggregated Wage Matrix

The matrix resulting from the previous step is still at the 400 by 201 dimension. We need it at the 422 by 108 order, to match the reaggregated I-O matrix.

The BLS industries are SIC based, and BEA industries are pieces of SIC industries assembled in a unique scheme. The primary information I-O matrix is based on the BEA scheme, but creates totally new industries. Hence, a fairly complicated bridge table was necessary to convert the original BLS scheme onto the 108 industry scheme. To conserve space, it is not included here but is available upon request.

Once the bridge table was produced, we "collapsed" the 201 industry scheme onto the 108 industry scheme and rebalanced the matrix to maintain consistence with the new industry control totals. Again, this balancing routine required very few iterations to force convergence. We are satisfied that both the procedure and the results are valid. The resulting 1967 employee compensation matrix is the most complete breakdown of labor income by type of occupation that is available for 1967 and 1970. Table 1 lists the 108 industries contained in the matrix.

Producing a Property-type (Proprietors') Income Matrix

Property-type income includes many nonlabor components, such as profits, capital consumption allowances, and so on. But it also includes proprietors' income and unpaid family workers' income. Since the definition of value added in the secondary information sector includes information labor employed or working in noninformation industries, we need to know the "compensation" paid to self-employed information workers in detail. Hence, we replicated the procedure outlined above for proprietors and unpaid family workers, with one major exception. The matrices were not balanced after they were collapsed down to the 125 industry scheme. The reason for this is that the level of accuracy which could be gained by rebalancing was trivial in comparison to the total value added in 1967. It was a waste of time to "overkill" accuracy here. No claim can be made for accuracy within any given occupation or industry, since proprietors' income is by definition a mix of both an imputed "salary" and retained earnings. The point of this exercise was to estimate the imputed employee compensation to self-employed people, and to then segregate the group into information and noninformation workers. For this purpose, the matrix is more than adequate.

FOOTNOTES

¹For example, a study on office automation may group several occupations as subject to productivity gains, others as insensitive to new technology. The matrix allows a ready method for estimating the expected gains (in wage terms) across all industries. Another application is to investigate substitution effects between different types of labor in response to changes in the occupation's productivity.

²One class of production function that makes excellent use of disaggregated factors of production is the translog. See L. Christiansen, D. Jorgenson, L. Lau, "Transcendental Logarithmic Production Frontiers," *Review of Economics and Statistics*, Vol. LV, No. 1, February 1973.

³Bureau of Labor Statistics, "Annual Wage Survey"; Civil Service Commission, "Survey of Wages"; Bureau of Economic Analysis, employee compensation by industry data at the 367- and 82-industry level (see published Input-Output data); Internal Revenue Service, *Statistics of Income for Corporations and Partnerships*.

14. SUPPLEMENTARY NOTES			
15. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography of literature survey, mention it here.) This report series defines and measures the "information activity" within the national economy. "Information activity" is defined to include those specific industries and occupations whose primary function is to produce, process or transmit economically valuable information. Changes in the national labor force are analyzed over a 120-year span. Information activities have grown dramatically over the last several decades, until they employed 46% of the labor force in 1970. National Income and Product accounts are analyzed to determine the contribution of the information activities to wages and capital expenditures. Information workers earned 53% of total wages in 1970; 46% of value added was derived from information activities in 1967. Input-Output tables have been constructed which show the detailed structure of the information economy. Volumes 1 and 2 summarize the findings. Volumes 3, 4, and 5 set forth the Input-Output tables. Volumes 6 through 8 detail the workforce and National Income accounts. Volume 9 describes the database available on computer readable magnetic tape.
